

HUBUNGAN KELENGKAPAN FASILITAS TERHADAP PERMINTAAN PELAYANAN PREVENTIF KESEHATAN GIGI PADA PUSKESMAS KOTA DENPASAR 2011

I Nyoman Wirata¹

Abstract. *Study was aimed at identifying attempt made to preventively take care of teeth at BPG of the Public Health Centers in Denpasar City is intended to improve the people's tooth and mouths. However, the request for the attempt made to preventively take care of teeth is lower than the request for the attempt made to cure teeth. This studied aims at identified the facility completeness, and the request for preventive tooth health care services at the Public Health Centers in Denpasar City. This study was a non experimental one with cross sectional planning. 100 respondents, which were taken using proportional random sampling technique, were used as the samples. The data were analyzed using univariate and bivariate. The result of spearman correlation test showed that there were three insignificant variables health services facilities was $r = 0,333^{**}$ and $pd > 0.05$. The facility completeness dominantly correlated with preventive tooth health care services at the Public Health Centers in Denpasar City.*

Keywords : *facility completeness, request for preventive tooth health care services, Public Health Center*
